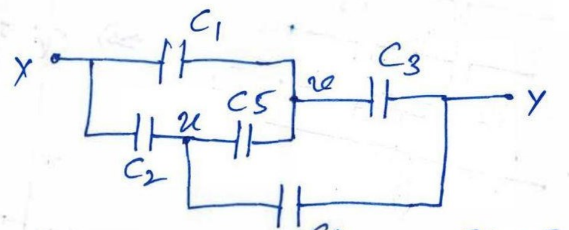
CSET102L

Tutorial Sheet - 7 (Solutions)

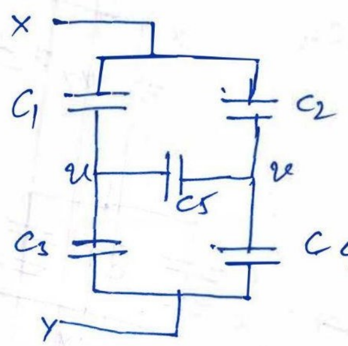
1)

Fig. 4



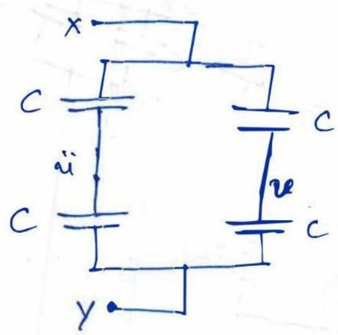
redraw the circuit

$C_i = C$



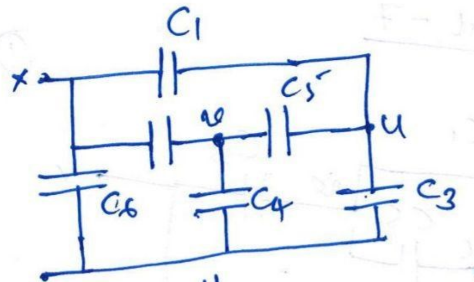
$\because C_i = C,$

Capacitor between u and v acts like a open. Then, re-drawing the circuit

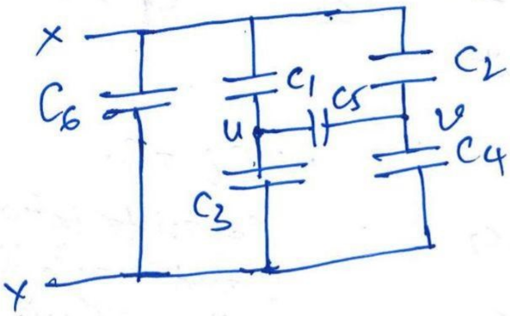


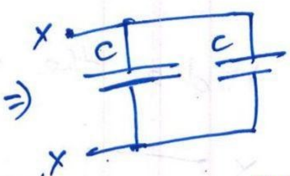
$\Rightarrow C_{xy} = C$

Note: Fig. 6 is similar except one more capacitor in parallel



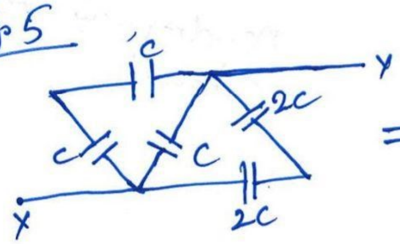
$\Rightarrow C_i = C$



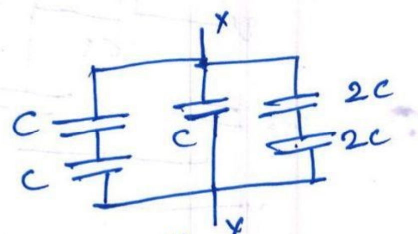


$\Rightarrow C_{xy} = \underline{2C}$

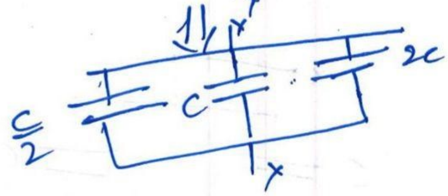
Fig 5



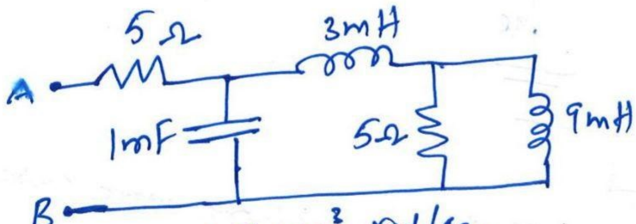
$\Longrightarrow$



$C_{eq} = 2.5C \quad \Leftarrow$



2)



$\omega = 2.5 \times 10^{3}$ rad/sec.

$X_{1mF} = -\frac{j}{\omega C} = -j0.4\,\Omega$

$X_{3mH} = j\omega L = j7.5\,\Omega$

$X_{9mH} = j\omega L = j22.5\,\Omega$

$$5 \parallel X_{9mH} = \frac{5 \times j22.5}{5 + j22.5} = \frac{112.5j\,(5 - j22.5)}{(5 + j22.5)(5 - j22.5)}$$

$$= \frac{562.5j + 2531.25}{(5)^2 + (22.5)^2} = 4.76 + 1.05j$$

$$(5 \parallel X_{9mH}) + X_{3mH} = 4.76 + 1.05j + j7.5$$

$$= 4.76 + j8.55$$

$$X_{1mF} \parallel \left[(5 \parallel X_{9mH}) + X_{3mH}\right] =$$

$$= \frac{(4.76 + j8.55)(-j0.4)}{(4.76 + j8.55 - j0.4)}$$

$$= \frac{3.42 - j1.904}{(4.76 + j8.15)}$$

writing in $|z| \angle\theta$ or $r\angle\theta$ form,

$$\underset{(a)}{3.42} - j\underset{(-b)}{1.904} = 3.91 \angle -29.1^\circ \qquad \theta = \tan^{-1}(b/a)$$

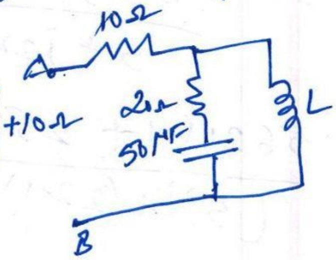
$$4.76 + j8.15 = 9.438 \angle 59.71^\circ \qquad r = \sqrt{a^2 + b^2}$$

$$X = \frac{3.91 \angle -29.1}{9.438 \angle 59.71^\circ} = 0.414 \angle -88.1^\circ$$

$= -0.414j + 0.014$

$Z = 5\Omega + X =$ 5.014 - j0.414

3) given $Z_{AB} = 25 + j10\Omega$ $\omega = 4\times10^3$ rad/sec.



$Z_{AB} = \left[j\omega L // \left(20 - \frac{j}{\omega C}\right)\right] + 10\Omega$

$25 + j10 = 10 + j\omega L$ $\omega C =$

$20 - \frac{j}{\omega C} = 20 - j5$

$j\omega L // (20 - j5) = \frac{j\omega L(20 - j5)}{(20 - j5 + j\omega L)}$

$25 + j10 - 10 = \frac{j20\omega L + 5\omega L}{(20 + j(\omega L - 5))}$

$(15 + j10)\left[20 + j(\omega L - 5)\right] = 5\omega L + j20\omega L$

Equating real parts

$300 - 10\omega L + 50 = 5\omega L \Rightarrow L = \underline{5.83\text{ mH}}$

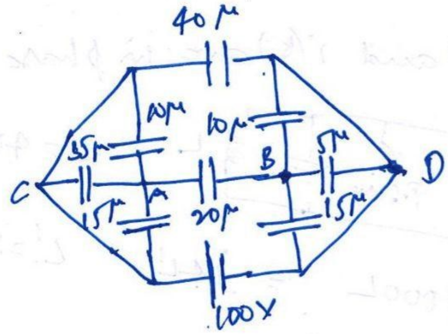
Equating imaginary parts,

$200j - 75j + j15\omega L = 20\omega L$

$125 = 5\omega L \Rightarrow L = \underline{6.25\text{ mH}}$

So two inductance values are possible.

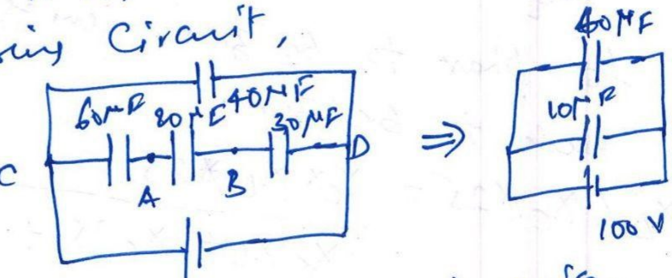
4)



$10\mu \parallel 35\mu \parallel 15\mu = 60\mu F$

$5\mu \parallel 15\mu \parallel 10\mu = 30\mu F$

re-drawing Circuit,



As 60μF, 20μF, 30μF are in series,

$$C_{eq} = 1/\left[\frac{1}{60} + \frac{1}{20} + \frac{1}{30}\right] = 10\mu F$$

$10\mu F \parallel 40\mu F = 50\mu F$

$Q = C_{eq} V = 50\times10^{-6}\times100 = 5000\mu C$

Charge in 10μF capacitance is
$100 \times 10\mu F = 1000\mu C$

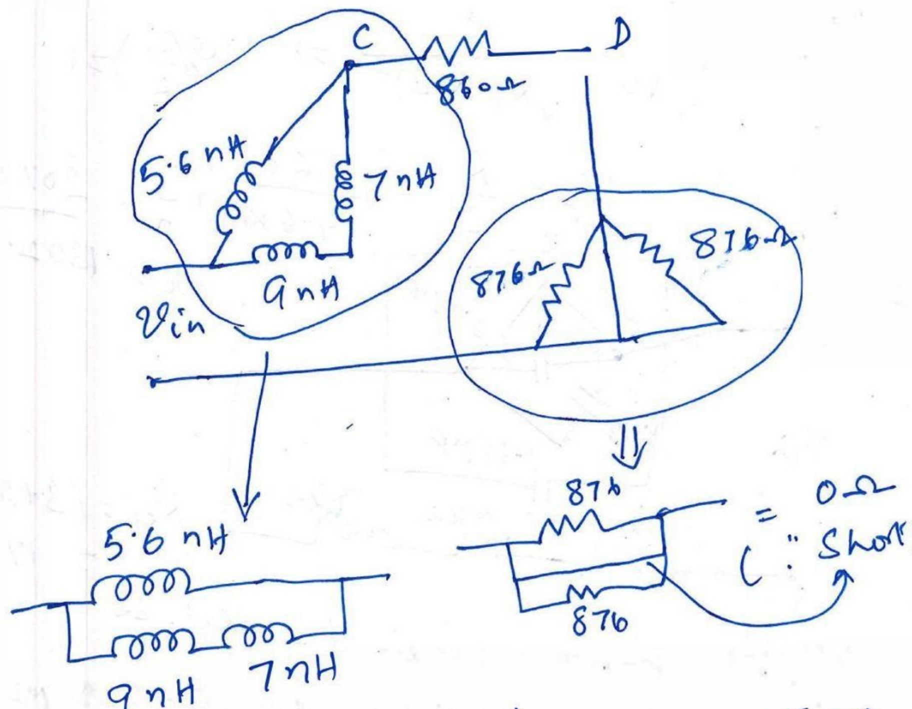
So charge on 20μF capacitance is
~~200~~ 1000μC

So voltage across 20μF capacitance is

$$V = \frac{Q}{C} = 50V$$

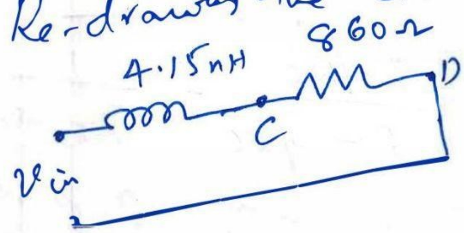
So the energy stored in the capacitor is given by 1/2 cv^2 = 0.025 W

1)



$$\frac{1}{L_{eq}} = \frac{1}{(9n+7n)} + \frac{1}{(5.6n)} \Rightarrow \underline{L_{eq} = 4.15\ nH}$$

Re-drawing the circuit



$$H(\omega) = \frac{V_R}{V_R + V_L}$$

$$= \frac{R}{R + j\omega L}$$

$$|H(\omega)| = \frac{R}{\sqrt{R^2 + \omega^2 L^2}} = \frac{1}{(1 + \omega^2 2.38 \times 10^{-23})^{1/2}}$$

at $\omega = 0$, $|H(\omega)| = 1$
at $\omega = \infty$ $|H(\omega)| = 0$ } Thus a lowpass filter

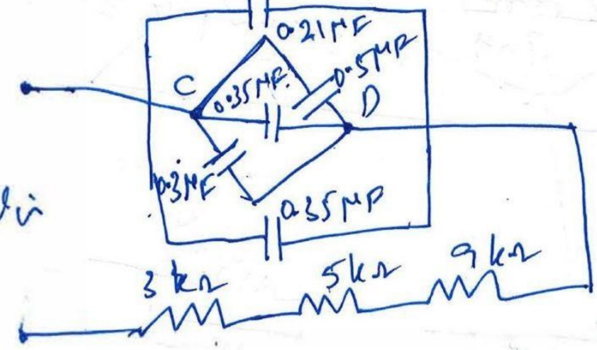
when $|H(\omega)| = \frac{1}{\sqrt{2}}$

$$\frac{1}{\sqrt{2}} = \frac{R}{\sqrt{R^2 + (\omega L)^2}} \Rightarrow \omega_c\left(\frac{L}{R}\right) = 1$$

$$\omega_c = \frac{R}{L} = \frac{860}{4.6\times10^{-9}}\frac{\Omega}{H} = \underline{207.3} \text{ rad/sec}$$

f_C=32.98 GHz

2)

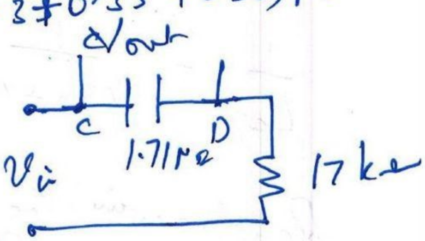


$R_{eq} = (3+5+9)\,k\Omega$
$= 17\,k\Omega$

All the capacitors are in parallel. so

$C_{eq} = (0.21 + 0.5 + 0.3 + 0.35 + 0.35)\,\mu F$
$= 1.71\,\mu F$

Re-drawing the circuit



$$H(\omega) = \frac{V_C}{V_R + V_C} = \frac{-j/\omega C}{R - j/\omega C} = \frac{1}{1 + j\omega RC}$$

$$|H(\omega)| = \frac{1}{\sqrt{1 + (\omega RC)^2}}$$ when $\omega = 0$

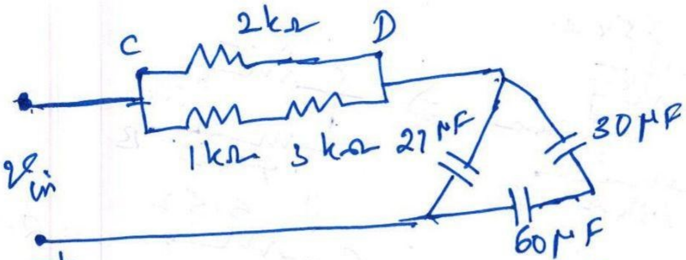
Low pass filter $\Leftarrow \begin{cases} |H(\omega)| = 1 \\ |H(\omega)| = 0 \text{ for } \omega = \infty \end{cases}$

$|H(\omega)| = \frac{1}{\sqrt{2}} \Rightarrow \omega_c RC = 1 \quad f_c = \frac{1}{2\pi RC}$

$f_c = \underline{5.47\ Hz}$

$$|H(\omega)| = \frac{1}{\sqrt{1 + (0.029)^2\omega^2}}$$

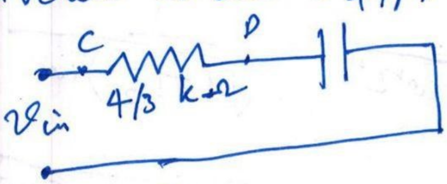
3)



$$R_{eq} = \frac{1}{2k} + \frac{1}{(1k+3k)} \Rightarrow R_{eq} = \frac{4}{3}\ k\Omega$$

$$C_{eq} = 27\mu F + \frac{1}{\left(\frac{1}{60\mu} + \frac{1}{30\mu}\right)} = (27+20)\mu F = 47\mu F$$

Equivalent circuit:



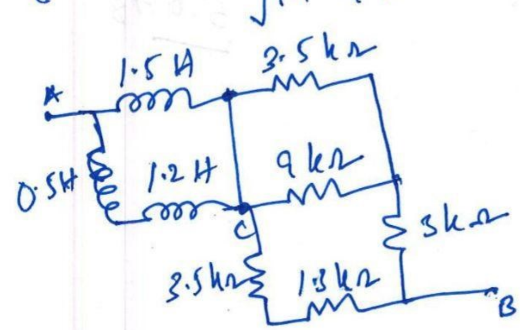
$$H(\omega) = \frac{V_R}{V_R + V_C}$$

$$|H(\omega)| = \frac{R}{\sqrt{R^2 + \frac{1}{\omega^2 C^2}}} = \frac{1}{\sqrt{1 + \frac{1}{(\omega RC)^2}}} = \frac{\omega RC}{\sqrt{1 + (\omega RC)^2}}$$

$$\left.\begin{array}{l} \omega \to 0 \Rightarrow H(\omega) \to 0 \\ \omega \to \infty \Rightarrow H(\omega) \to 1 \end{array}\right\} \to \text{High pass filter}$$

$$|H(\omega)| = \frac{0.063\omega}{\sqrt{1 + 4\times 10^{-3}\omega^2}} \qquad f_c = \frac{1}{2\pi RC} = 2.54\ Hz$$

4)

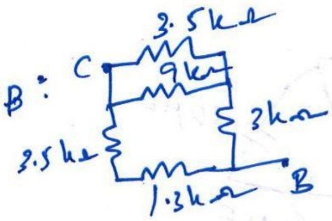


$$\frac{1}{L_{eq}} = \frac{1}{1.5} + \frac{1}{(1.2+0.5)}$$

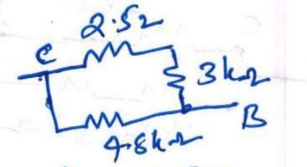
$$\Rightarrow L_{eq} \simeq 0.8H$$

④

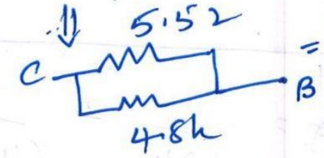
R_{CB} :



$\Rightarrow$

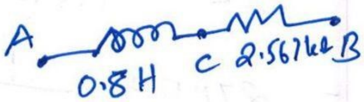


$\Downarrow$



$= 2.567 k\Omega$

Equivalent circuit:



$$H(\omega) = \frac{V_R}{V_L + V_C} = \frac{R}{j\omega L + R}$$

$$|H(\omega)| = \frac{R}{\sqrt{R^2 + \omega^2 L^2}} = \frac{1}{\sqrt{1 + \left(\frac{L}{R}\right)^2 \omega^2}}$$

$$= \frac{1}{\sqrt{1 + 0.097\omega^2 \times 10^{-6}}}$$

$$\left.\begin{array}{l} \omega \to 0 \quad |H(\omega)| \to 1 \\ \omega \to \infty \quad |H(\omega)| \to 0 \end{array}\right\} \Rightarrow \text{low pass filter}$$

f_c: $|H(\omega)| = \frac{1}{\sqrt{2}} \Rightarrow \frac{1}{2} = \frac{1}{1 + 0.097\omega^2 \times 10^{-6}}$

$\omega_c = \frac{1}{\sqrt{0.97}}$ $\quad f_c = \frac{1}{2\pi \times \sqrt{0.097 \times 10^{-6}}}$

$= \underline{510\ Hz}$
